**ABSTRACT**

A behavioral training tool and a method for making and using the tool. The tool is produced by making a recording of an interaction between a first person and an entity, where the recording may include information from both the first person and the entity. An evaluation of the interaction may be generated contemporaneously or subsequent to the recording. The recording and the evaluation may be combined to produce a product, such as a multimedia program that can be observed by a user to train the user to recognize qualities of the interaction. The user may make inputs to a system that includes the product, and the inputs can be compared to the evaluation for teaching and assessment purposes.
